EDUCATION

Stanford University

Stanford, CA

Candidate for Bachelor of Science in Computer Science, Systems Track

Sep. 2023 – June 2027

GPA: 3.9/4.0

Relevant Coursework at Stanford:

- Computer Systems:** Computer Systems Programming, Computer System Architecture, Operating System Design
- Programming:** Data Structures & Algorithms, Parallel Computing, Computer Networking, Embedded Systems
- Artificial Intelligence:** Hardware Accelerators for Machine Learning, Computer Graphics, The Impact of AI

PROJECTS

Bare Metal RISC-V DOOM Port | C, ASM, RISC-V, MangoPi

Jul. 2025 – Aug. 2025

- Ported 1993 DOOM video game to bare metal RISC-V, replacing file I/O with DMA to eliminate OS dependencies
- Engineered drivers for I2C input, I2S-audio, and SPI video with DMA, achieving 20+ fps on the LCD framebuffer
- Implemented a custom C standard library from scratch, extending memory and string routines for bare metal use

Embedded RISC-V Robotic Image Plotter | C, ASM, RISC-V, MangoPi, Python

Jan. 2024 – Mar. 2024

- Delivered a working prototype that prints pixel-accurate images made of LEGOs with a live feedback display
- Engineered a cross-platform data pipeline that serializes images via Python into C structs for bare metal execution
- Implemented image processing in C (downscaling, color quantization) to map pixels to a limited LEGO palette
- Built a full user interface on the MangoPi for image selection, scale, and real-time printing progress tracking

EXPERIENCE

Embedded Systems Intern

June 2025 – Aug. 2025

Stanford University – Computer Systems from the Ground Up Course Infrastructure

Stanford, CA

- Optimized drivers (I2C, SPI, DMA) for 12+ peripherals (OLEDs, cameras, sensors) with improved reliability
- Redesigned I2C/I2S APIs into a unified Hardware Abstraction Layer (HAL), improving system stress-test stability
- Extended platform: ported legacy code to RISC-V, designed custom PCBs, and documented the Vector Extension

Independent Computational Researcher | Python, scikit-learn, Pandas, Seaborn

Jan. 2021 – June 2023

University of Rochester

Rochester, NY

- Designed 4 modular analysis pipelines in Python (scikit-learn) to process 50M+ avian migration data points
- Generated 100+ geospatial maps (pygmt, Seaborn) correlating magnetic anomalies with population decline
- Published a formal research manuscript results and presented findings at Regeneron STS (Science Talent Search)

TEACHING

Teaching Assistant (CS107E: Computer Systems)

Jan. 2026 – Present

Stanford University – Department of Computer Science

Stanford, CA

- Supported weekly labs teaching bare metal development topics: strings, printf, memory layout, and graphics
- Held office hours to guide students through complex assignments on C standard libraries and hardware drivers
- Authored technical guides and developed helper libraries to enable students to build advanced final projects

Teaching Assistant (CS106A/B: Intro to CS)

Apr. 2024 – Aug. 2025

Stanford University – Department of Computer Science

Stanford, CA

- Led weekly sections for 10+ students, teaching fundamental concepts in Python (CS106A) & C++ (CS106B)
- Oversaw biweekly grading sessions with students to provide 1-on-1 feedback on all programming assignments
- Debugged complex student programs in Python & C++ during office hours, and evaluate quarterly examinations

TECHNICAL SKILLS

Programming Languages: C, C++, Assembly (RISC-V/MIPS), Verilog, Python, Java, CUDA, Triton

Developer Tools: Linux Command Line, Conda, AI Copilot, Jupyter Notebook, gdb, Make, Git, AWS

Computing Platforms: MangoPi, RaspberryPi, RTX 4070 & GTX 1080 GPUs, Xilinx PYNQ-Z2 FPGA
